

Authenticating with NHCX

To access the NHCX APIs hosted on NHCX sandbox application, each provider or payer needs to register themselves through ABDM sandbox entry process. Upon approval of the application form, each entity will be provided with client id and secret key.

Using the credentials, health insurance provider or payer obtains a time-limited token, valid for X number of seconds, with which it identifies itself to the HCX Gateway. When the token's time limit elapses, the health insurance provider or payer should call sessions API to renew the token. When calling any API, the provider or payer should pass the authentication token as part of the 'Authorization' http header.

Following is the curl command to obtain the Authorization Token

```
curl --location --request POST 'https://dev.abdm.gov.in/gateway/v0.5/sessions' --header 'Content-Type: application/json' \
  - data-raw '
  -
  {
    "clientId": "clientId-you-received",
    "clientSecret": "secret-you-received"
  }
```

Following the response

```
{
  "accessToken": "JWT token", "expiresIn": 300,
  "refreshTokenIn": 300,
  "refreshToken": "JWT token",
  "tokenType": "bearer"
}
```

Note: Any provider who obtains the client id and secret key for ABDM ABHA integration, can use the same credentials for accessing the NHCX gateway. No separate credentials required.
