

Onboarding providers and payers

NHCX participant registry acts as a source of truth for participant information on the platform. This registry stores key details about the participants on the exchange who can exchange data through it and exposes open APIs to manage & access the registry data.

- A Payer when registering with the NHCX provides required details necessary for validation. It is validated against a trusted Payer registry.
- A TPA when registering with the NHCX platform provides required details necessary for validation. It is validated against a trusted TPA registry.
- A Provider when registering with the NHCX platform provides required details necessary for validation. It is validated against a trusted Provider registry ie HFR registry of ABDM.
- A Provider or Payer (TPA or IC) can execute claims requests in NHCX only when they are validated by the platform. Claims request however needs to be validated separately.

API Definition - Create Participant

Name of the API	/participate/create
Description/Purpose	This API is to create a participant in the registry. API generates a unique participant code and returns the code in the response on successful creation of participant.
Input (API to be consumed by)	providers, payers
